Ottawa

Note of Appreciation

*Canada owes the success of its statistical
system to a long-standing cooperation involving
Statistics Canada, the citizens of Canada, its
businesses, governments and other institutions.
Accurate and timely statistical information could
not be produced without their continued
cooperation and goodwill.*

Ottawa

Note de reconnaissance

*Le succès du système statistique du Canada repose sur
un partenariat bien établi entre Statistique Canada et la
population, les entreprises, les administrations
canadiennes et les autres organismes. Sans cette
collaboration et cette bonne volonté, il serait impossible
de produire des statistiques précises et actuelles.*

Definitions

Census Family Status

Refers to the classification of the population according to whether or not they are members of a census family.

Family persons refers to household members who belong to a census family

Non-family persons refers to household members who do not belong to a census family. They may be related to Person 1, the household reference person (e.g., Person 1's divorced brother, brother-in-law, cousin, grandparent), or **unrelated** (e.g., lodger, room-mate, employee). A person living alone is always a non-family person.

Census Family Structure

Refers to the classification of census families into **families of now-married couples** (with or without never-married sons or daughters of either or both spouses), **families of common-law couples** (with or without never-married sons or daughters of either or both partners) and **lone-parent families** by sex of parent.

Supplementary definition

Families of now-married couples and those of common-law couples together constitute "**husband-wife families**".

Economic Family

Refers to a group of two or more persons who live in the same dwelling and are related to each other by blood, marriage, common-law or adoption.

Supplementary definition

The economic family concept requires only that family members be related by blood, marriage, common-law or adoption. By contrast, the census family concept requires that family members be either male or female spouse, male or female common-law partner or never-married son or daughter with a parent present. The concept of economic family may therefore refer to a larger group of persons than does the census family concept. For example: a widowed mother living with her married son and daughter-in-law would be treated as a non-family person under the definition of a census family. That same person would, however, be counted as a member of an economic family along with her son and daughter-in-law. Two or more related families living

together also constitute one economic family as, for example, a man and his wife living with their married son and daughter-in-law. Two or more brothers or sisters living together, apart from their parents, will form an economic family, but not a census family since they do not meet the requirements for the latter. All census family persons are economic family persons.

Federal Electoral District (FED)

A federal electoral district refers to any place or territorial area entitled to elect a representative member to serve in the House of Commons (source: Canada Elections Act, 1990). There are 295 FEDs in Canada according to the 1987 Representation Order and there are 301 FEDs in Canada according to the 1996 Representation Order.

Household, Private

Refers to a person or a group of persons (other than foreign residents) who occupy a private dwelling and do not have a usual place of residence elsewhere in Canada.

Household Size

Refers to the number of persons in a private household.

Income: Census Family Total Income

The total income of a census family is the sum of the total incomes of all members of that family.

Total Income

Refers to the total money income received from the following sources during calendar year 1995 by persons 15 years of age and over:

- wages and salaries (total);
- net farm income;
- net non-farm income from unincorporated business and/or professional practice;
- federal Child Tax benefits;
- Old Age Security pension and Guaranteed Income Supplement;
- benefits from Canada or Quebec Pension Plan;
- benefits from Unemployment Insurance;
- other income from government sources;
- dividends, interest on bonds, deposits and savings certificates, and other investment income;
- retirement pensions, superannuation and annuities, including those from RRSPs and RRIFs;
- other money income.

Receipts Not Counted as Income

Gambling gains and losses, money inherited during the year, capital gains or losses, receipts from the sale of property or personal belongings, income tax refunds, loans received, loans repaid to an individual as the lender, lump-sum settlements of insurance policies, rebates of property taxes and other taxes, and refunds of pension contributions were excluded as was all income "in kind" such as free meals, living accommodations, or agricultural products produced and consumed on the farm.

Average Income of Census Families and Non-family Persons 15 Years of Age and Over

Average census family income refers to the weighted mean total income of census families.

Average income is calculated from unrounded data by dividing the aggregate income of a specified group of families (e.g., husband-wife families with working wives) by the number of families in that group, whether or not they reported income. Similarly, the average income of a group of non-family persons is calculated from unrounded data by dividing the aggregate income of the specified group by the number of all non-family persons 15 years of age and over in the group, whether or not they reported income.

Median Income of Census Families and Non-family Persons 15 Years of Age and Over

The median income of a specified group of census families or non-family persons 15 years of age and over is that amount which divides their income size distribution into two halves, i.e. the incomes of the first half of the families or non-family persons are below the median, while those of the second half are above the median.

The median income of census families and non-family persons is calculated for all units in the specified group, whether or not they reported income.

Standard Error of Average Income

Refers to the estimated standard error of average income for an income size distribution. If interpreted as shown below, it serves as a rough indicator of the precision of the corresponding estimate of average income. For about 68% of the samples which could be selected from the sample frame, the difference between the sample estimate of average income and the corresponding figure based on complete enumeration would be less than one standard error. For about 95% of the possible samples, the difference would be less than two standard errors and, in about 99% of the samples, the difference would be approximately two and a half standard errors.

Income: Composition of Income

The composition of the total income of a population group or a geographic area refers to the relative share of each income source or group of sources, expressed as a percentage of the aggregate total income of that group or area.

Income: Employment Income/Earnings

Refers to total income received by persons 15 years of age and over during 1995 as:

Wages and Salaries

Refers to gross wages and salaries before deductions for such items as income tax, pensions and unemployment insurance. Included in this source are military pay and allowances, tips, commissions and cash bonuses, as well as all types of casual earnings during calendar year 1995. The value of taxable allowances and benefits provided by employers, such as free lodging and free automobile use, is excluded.

Net Non-farm Income from Unincorporated Business and/or Professional Practice

Refers to net income (gross receipts minus expenses of operation such as wages, rents and depreciation) received during calendar year 1995 from the respondent's non-farm unincorporated business or professional practice. In the case of partnerships, only the respondent's share was reported. Also included is net income of persons babysitting in their own homes, self-employed fishermen, hunters and trappers, operators of direct distributorships such as those selling and delivering cosmetics, as well as from freelance activities of artists, writers, music teachers, hairdressers, dressmakers, etc.

Net Farm Income

Refers to net income (gross receipts from farm sales minus depreciation and cost of operation) received during calendar year 1995 from the operation of a farm, either on own account or in partnership. In the case of partnerships, only the respondent's share of income was reported. Also included are cash advances, dividends from cooperatives, gross insurance proceeds and all rebates and farm-support payments to farmers from federal, provincial and regional agricultural programs (e.g., milk subsidies and marketing board payments). However, the value of income "in kind", such as agricultural products produced and consumed on the farm, is excluded.

Supplementary definition

Average Income of Individuals

Average income of individuals refers to the weighted mean total income of individuals 15 years of age and over who reported income. Average income is calculated from unrounded data by dividing the aggregate income of a specified group of individuals (e.g., males 45 to 54 years of age) by the number of individuals with income in that group.

This concept and procedure applies to total income, employment income, wages and salaries and any other component of income.

Median Income of Individuals

The median income of a specified group of income recipients is that amount which divides their income size distribution into two halves, i.e. the incomes of the first half of individuals are below the median, while those of the second half are above the median.

This concept and procedure applies to total income, employment income, wages and salaries and any other component of income.

Standard Error of Average Income

Refers to the estimated standard error of average income for an income size distribution. If interpreted as shown below, it serves as a rough indicator of the precision of the corresponding estimate of average income. For about 68% of the samples which could be selected from the sample frame, the difference between the sample estimate of average income and the corresponding figure based on complete enumeration would be less than one standard error. For about 95% of the possible samples, the difference would be less than two standard errors and, in about 99% of the samples, the difference would be approximately two and a half standard errors.

Income: Household Total Income

The total income of a household is the sum of the total incomes of all members of that household.

Total Income

Refers to the total money income received from the following sources during calendar year 1995 by persons 15 years of age and over:

- wages and salaries (total);
- net farm income;
- net non-farm income from unincorporated business and/or professional practice;
- federal Child Tax benefits;

- Old Age Security pension and Guaranteed Income Supplement;
- benefits from Canada or Quebec Pension Plan;
- benefits from Unemployment Insurance;
- other income from government sources;
- dividends, interest on bonds, deposits and savings certificates, and other investment income;
- retirement pensions, superannuation and annuities, including those from RRSPs and RRIFs;
- other money income.

Receipts Not Counted as Income

Gambling gains and losses, money inherited during the year, capital gains or losses, receipts from the sale of property or personal belongings, income tax refunds, loans received, loans repaid to an individual as the lender, lump-sum settlements of insurance policies, rebates of property taxes and other taxes, and refunds of pension contributions were excluded as was all income "in kind" such as free meals, living accommodations, or agricultural products produced and consumed on the farm.

Average Income of Households

Average household income refers to the weighted mean total income of households.

Average income is calculated from unrounded data by dividing the aggregate income of a specified group of households (e.g., family households) by the number of households in that group, whether or not they reported income.

Median Income of Households

The median income of a specified group of households is that amount which divides their income size distribution into two halves, i.e. the incomes of the first half of households are below the median, while those of the second half are above the median.

The median income of households is calculated for all units in the specified group, whether or not they reported income.

Standard Error of Average Income

Refers to the estimated standard error of average income for an income size distribution. If interpreted as shown below, it serves as a rough indicator of the precision of the corresponding estimate of average income. For about 68% of the samples which could be selected from the sample frame, the difference between the sample estimate of average income and the corresponding figure based on complete enumeration would be less than one standard error. For about 95% of the possible samples, the difference would be less than two standard errors

and, in about 99% of the samples, the difference would be approximately two and a half standard errors.

Income: Incidence of Low Income

The incidence of low income is the proportion or percentage of economic families or unattached individuals in a given classification below the low income cut-offs. These incidence rates are calculated from unrounded estimates of economic families and unattached individuals 15 years of age and over. Since all members of an economic family share a common status, incidence of low income can also be calculated for the population in private households.

Income Status

Refers to the position of an economic family or an unattached individual 15 years of age and over in relation to Statistics Canada's low income cut-offs (LICOs).

Low Income Cut-offs (LICOs)

Measures of low income known as low income cut-offs (LICOs) were first introduced in Canada in 1968 based on 1961 Census income data and 1959 family expenditure patterns. At that time, expenditure patterns indicated that Canadian families spent about 50% of their income on food, shelter and clothing. It was arbitrarily estimated that families spending 70% or more of their income on these basic necessities would be in "straitened" circumstances. With this assumption, low income cut-off points were set for five different sizes of families.

Subsequent to these initial cut-offs, revised low income cut-offs were established based on national family expenditure data from 1969, 1978, 1986 and 1992. These data indicated that Canadian families spent, on average, 42% in 1969, 38.5% in 1978, 36.2% in 1986 and 34.7% in 1992 of their income on basic necessities. By adding the original difference of 20 percentage points to the basic level of expenditure on necessities, new low income cut-offs were set at income levels differentiated by family size and degree of urbanization. Since then, these cut-offs have been updated yearly by changes in the consumer price index.

In the 1991 Census publication *Selected Income Statistics*, catalogue No. 93-331, data on the incidence of low income in 1990 were published based on the 1986 low income cut-offs updated by changes in the CPI to 1990. These statistics will not be comparable with those from the 1996 Census as the LICOs have since been revised.

Income: Total Income

Refers to the total money income received from the following sources during calendar year 1995 by persons 15 years of age and over:

- wages and salaries (total);
- net farm income;
- net non-farm income from unincorporated business and/or professional practice;
- federal Child Tax benefits;
- Old Age Security pension and Guaranteed Income Supplement;
- benefits from Canada or Quebec Pension Plan;
- benefits from Unemployment Insurance;
- other income from government sources;
- dividends, interest on bonds, deposits and savings certificates, and other investment income;
- retirement pensions, superannuation and annuities, including those from RRSPs and RRIFs;
- other money income.

Receipts Not Counted as Income

Gambling gains and losses, money inherited during the year, capital gains or losses, receipts from the sale of property or personal belongings, income tax refunds, loans received, loans repaid to an individual as the lender, lump-sum settlements of insurance policies, rebates of property taxes and other taxes, and refunds of pension contributions were excluded as was all income "in kind" such as free meals, living accommodations, or agricultural products produced and consumed on the farm.

Average Income of Individuals

Average income of individuals refers to the weighted mean total income of individuals 15 years of age and over who reported income. Average income is calculated from unrounded data by dividing the aggregate income of a specified group of individuals (e.g., males 45 to 54 years of age) by the number of individuals with income in that group.

This concept and procedure applies to total income, employment income, wages and salaries and any other component of income.

Median Income of Individuals

The median income of a specified group of income recipients is that amount which divides their income size distribution into two halves, i.e. the incomes of the first half of individuals are below the median, while those of the second half are above the median.

This concept and procedure applies to total income, employment income, wages and salaries and any other component of income.

Standard Error of Average Income

Refers to the estimated standard error of average income for an income size distribution. If interpreted as shown below, it serves as a rough indicator of the precision of the corresponding estimate of average income. For about 68% of the samples which could be selected from the sample frame, the difference between the sample estimate of average income and the corresponding figure based on complete enumeration would be less than one standard error. For about 95% of the possible samples, the difference would be less than two standard errors and, in about 99% of the samples, the difference would be approximately two and a half standard errors.

Labour Market Activities: Work Activity in 1995 (Derived)

Refers to the number of weeks in which a person worked for pay or in self-employment in 1995 at all jobs held, even if only for a few hours, and whether these weeks were mostly full time (30 hours or more per week) or mostly part time (less than 30 hours per week). Data are available for persons 15 years of age and over, excluding institutional residents.

Weeks worked in the reference year include weeks of paid vacation, weeks on sick leave with pay and all weeks in which training was paid for by the employer. Persons who worked less than a year but who were paid on a twelve-month basis, such as school teachers, were instructed to report 52 weeks. Persons who operated a farm, business or professional practice for the full year, including weeks of vacation, were also instructed to report 52 weeks.

The term "full-year full-time workers" refers to persons 15 years of age and over, excluding institutional residents, who worked 49-52 weeks on a full time basis in the reference year for pay or in self-employment.

Sex

Refers to the gender of the respondent.

Unattached Individual

Refers to a household member who is not a member of an economic family. Unattached individuals may either live alone or in a household where they are not related to any other member of that household. Income statistics are produced for unattached individuals who are at least 15 years of age.

Data Quality

General

The 1996 Census was a large and complex undertaking and, while considerable effort was taken to ensure high standards throughout all collection and processing operations, the resulting estimates are inevitably subject to a certain degree of error. Users of census data should be aware such error exists, and have some appreciation of its main components, so that they can assess the usefulness of census data for their purposes and the risks involved in basing conclusions or decisions on these data.

Errors can arise at virtually every stage of the census process, from the preparation of materials through the listing of dwellings, data collection and processing. Some errors occur more or less at random, and when the individual responses are aggregated for a sufficiently large group, such errors tend to cancel out. For errors of this nature, the larger the group, the more accurate the corresponding estimate. It is for this reason that users are advised to be cautious when using small estimates. There are some errors, however, which might occur more systematically, and which result in "biased" estimates. Because the bias from such errors is persistent no matter how large the group for which responses are aggregated, and because bias is particularly difficult to measure, systematic errors are a more serious problem for most data users than the random errors referred to previously.

For census data in general, the principal types of error are as follows:

- **coverage errors**, which occur when dwellings and/or individuals are missed, incorrectly included or double counted;
- **non-response errors**, which result when responses cannot be obtained from a small number of households and/or individuals, because of extended absence or some other reason;
- **response errors**, which occur when the respondent, or sometimes the Census Representative, misunderstands a census question, and records an incorrect response;
- **processing errors**, which can occur at various steps including coding, when "write-in" responses are transformed into numerical codes; data capture, when responses are transferred from the census questionnaire to computer tapes by key-entry operators; and imputation, when a "valid", but not necessarily correct, response is inserted into a record by the computer to replace missing or "invalid" data ("valid" and "invalid" referring to

whether or not the response is consistent with other information on the record);

- **sampling errors**, which apply only to the supplementary questions on the "long form" asked of a one-fifth sample of households, and which arise from the fact that the results for these questions, when weighted up to represent the whole population, inevitably differ somewhat from the results which would have been obtained if these questions had been asked of all households.

The above types of error each have both random and systematic components. Usually, however, the systematic component of sampling error is very small in relation to its random component. For the other non-sampling errors, both random and systematic components may be significant.

Coverage Errors

Coverage errors affect the accuracy of the census counts, that is the sizes of the various census universes: population, families, households and dwellings. While steps have been taken to correct certain identifiable errors, the final counts are still subject to some degree of error resulting from persons or dwellings being missed, incorrectly included in the census or double-counted.

Missed dwellings or persons result in **undercoverage**. Dwellings can be missed because of the misunderstanding of enumeration area (EA) boundaries, or because they are not apparent (e.g. unmarked dwellings) or appear uninhabitable. Persons can be missed when their dwelling is missed or is classified as vacant, or when individual household members are omitted from the questionnaire because the respondent misinterprets the instructions on whom to include. Some individuals may be missed because they have no usual residence and did not spend census night in any dwelling.

Dwellings or persons that are incorrectly included or double counted result in **overcoverage**. Overcoverage of dwellings can occur when structures unfit for habitation are listed as dwellings, or when units which do not meet the census definition of a dwelling are listed separately instead of being treated as part of a larger dwelling. Double counting of dwellings also can occur because of ambiguity over EA boundaries. Persons can be double counted because their dwelling is double counted or because the guidelines on whom to include on the questionnaire have been misunderstood. occasionally, someone who is not in the census population universe, such as a foreign resident or a fictitious person, may, incorrectly, be enumerated in the census. On average, overcoverage is less likely to occur than undercoverage

and, as a result, counts of dwellings and persons are likely to be slightly underestimated.

In 1996, three studies are used to measure coverage error. In the Vacancy Check, a sample of dwellings listed as vacant was revisited to verify that they were vacant on Census Day. Adjustments have been made to the final census counts for households and persons missed because their dwelling was incorrectly classified as vacant. Despite these adjustments, the final counts are still subject to some undercoverage. Undercoverage tends to be higher for certain segments of the population such as young male adults and recent immigrants. The Reverse Record Check study is used to measure the residual undercoverage for Canada, and each province and territory. The Overcoverage Study is designed to investigate overcoverage errors. The results of the Reverse Record Check and the Overcoverage Study, when taken together, furnish an estimate of net undercoverage.

Other Non-sampling Errors

While coverage errors affect the number of units in the various census universes, other errors affect the characteristics of those units.

Sometimes, it is not possible to obtain a complete response from a household, even though the dwelling was identified as occupied and a questionnaire dropped off. The household members may have been away throughout the census period or, in rare instances, the householder may have refused to complete the form. More frequently, the questionnaire is returned but information is missing for some questions or individuals. Considerable effort is devoted to ensure as complete a response as possible. Census Representatives edit the questionnaires and follow up on missing information. Their work is then checked by both a supervisor and a quality control technician. Despite this, at the end of the collection stage, a small number of responses is still missing. Although missing entries are eliminated during processing by replacing a missing value by the corresponding entry for a "similar" record, there remain some potential **non-response errors**. This is particularly serious if the non-respondents differ in some respects from the respondents, since this procedure will result in non-response bias.

Even when a response is obtained, it may not be entirely accurate. The respondent may have misinterpreted the question or may have guessed the answer, especially when answering on behalf of another, possibly absent, household member. Such errors are referred to as **response errors**. While response errors usually arise from inaccurate information provided by respondents, they can also result from mistakes by the Census Representative when completing certain parts of the

questionnaire, such as structural type of dwelling, or when calling back to obtain a missing response.

Some of the questions on the census document require a written response. During processing, these "write-in" entries are given a numeric code. **Coding errors** can occur when the written response is ambiguous, incomplete, difficult to read or when the code list is extensive (e.g., Major Field of Study, Place of Work). A formal Quality Control (QC) operation is used to detect, rectify and reduce coding errors. Within each work unit, a sample of responses is independently coded a second time. The resolution of discrepancies between the first and second codings determines whether recoding of the work unit is necessary. Except for the Industry and Occupation variables, much of the census coding is now automated, partly in an effort to reduce the extent of coding errors.

The information on the questionnaires is key-entered onto a computer file. Two procedures are used to control the number of **data capture errors**. First, certain edits (such as range checks) are performed as the data are keyed. Second, a sample from each batch of documents is rekeyed and compared with the original entries. Unsatisfactory work is identified and corrected and the remainder of the batch is rekeyed as needed.

Once captured, the data are edited where they undergo a series of computer checks to identify missing or inconsistent responses. These are replaced during the imputation stage of processing where either a response consistent with the other respondent's data is inferred or a response from a similar donor is substituted. Imputation ensures a complete database where the data correspond to the census counts and facilitate multivariate analyses. Although imputation may introduce errors, the methods used have been rigorously tested to minimize systematic **imputation errors**.

Various studies are being carried out to evaluate the quality of the responses obtained in the 1996 Census. For each question, response rates and edit failure rates have been calculated. These can be useful in identifying the potential for non-response errors and other type of errors. Also, tabulations from the 1996 Census have been or will be compared with corresponding estimates from previous censuses, from sample surveys (such as the Labour Force Survey) and from various administrative records (such as birth registrations and municipal assessment records). Such comparisons can indicate potential quality problems or at least discrepancies between the sources.

In addition to these aggregate-level comparisons, there are some micro-match studies in progress, in which census responses are compared with another source of information at the individual record level. For certain "stable" characteristics (such as Age, Sex, Mother Tongue, Place of Birth), the responses obtained in the

1996 Census, for a sample of individuals, are being compared with those for the same individuals in the 1991 Census.

Sampling Errors

Estimates obtained by weighting up responses collected on a sample basis are subject to error due to the fact that the distribution of characteristics within the sample will not usually be identical to the distribution of characteristics within the population from which the sample has been selected.

The potential error introduced by sampling will vary according to the relative scarcity of the characteristics in the population. For large cell values, the potential error due to sampling, as a proportion of the cell value, will be relatively small. For small cell values, this potential error, as a proportion of the cell value, will be relatively large.

The potential error due to sampling is usually expressed in terms of the so-called "standard error". This is the square root of the average, taken over all possible samples of the same size and design, of the squared deviation of the sample estimate from the value for the total population.

The following table provides approximate measures of the standard error due to sampling. These measures are intended as a general guide only.

Approximate Standard Error Due to Sampling for 1996 Census Sample Data:

| Cell Value | Approximate Standard Error |
|------------|----------------------------|
| 50 or less | 15 |
| 100 | 20 |
| 200 | 30 |
| 500 | 45 |
| 1,000 | 65 |
| 2,000 | 90 |
| 5,000 | 140 |
| 10,000 | 200 |
| 20,000 | 280 |
| 50,000 | 450 |
| 100,000 | 630 |
| 500,000 | 1,400 |

Users wishing to determine the approximate error due to sampling for any given cell of data, based upon the 20% sample, should choose the standard error value corresponding to the cell value that is closest to the value of the given cell in the census tabulation. When using the obtained standard error value, in general the user can be

reasonably certain that, for the enumerated population, the true value (discounting all forms of error other than sampling) lies within plus or minus three times the standard error (e.g., for a cell value of 1,000, the range would be $1,000 \pm (3 \times 65)$ or $1,000 \pm 195$).

The standard errors given in the table above will not apply to population or universe (persons, households, dwellings or families) totals or subtotals for the geographic area under consideration (see Sampling and Weighting). The effect of sampling for these cells can be determined by comparison with a corresponding 100% data publication.

The effect of the particular sample design and weighting procedure used in the 1996 Census will vary, however, from one characteristic to another and from one geographic area to another. The standard error values in the table may, therefore, understate or overstate the error due to sampling.

Sampling and Weighting

The 1996 Census data were collected either from 100% of the population or on a sample basis (i.e. from a random sample of one in five households) with the data weighted up to provide estimates for the entire population. The information in this report was collected on a 20% sample basis and weighted up to compensate for sampling. All table headings are noted accordingly. Note that, on Indian reserves and in remote areas, all data were collected on a 100% basis.

For any given geographic area, the weighted population, household, dwelling or family total or subtotal may differ from that shown in reports containing data collected on a 100% basis. Such variation (in addition to the effect of random rounding) will be due to sampling.

Confidentiality and Random Rounding

The figures shown in the tables have been subjected to a confidentiality procedure known as "random rounding" to prevent the possibility of associating statistical data with any identifiable individual. Under this method, all figures, including totals and margins, are randomly rounded either up or down to a multiple of "5", and in some cases "10". While providing strong protection against disclosure, this technique does not add significant error to the census data. The user should be aware that totals and margins are rounded independently of the cell data so that some difference between these and the sum of rounded cell data may exist. Also, minor differences can be expected in corresponding totals and cell values among various census tabulations. Similarly, percentages, which are calculated on rounded figures, do not necessarily add up to 100%. Percentage distributions

and rates for the most part are based on rounded data, while percentage changes and averages are based on unrounded data. It should also be noted that small cell counts may suffer a significant distortion as a result of random rounding. Individual data cells containing small numbers may lose their precision as a result.

Users should be aware of possible data distortions when they are aggregating these rounded data. Imprecisions as a result of rounding tend to cancel each other out when data cells are re-aggregated. However, users can minimize these distortions by using, whenever possible, the appropriate subtotals when aggregating.

For those requiring maximum precision, the option exists to use custom tabulations. With custom products, aggregation is done using individual census database records. Random rounding occurs only after the data cells have been aggregated, thus minimizing any distortion.

In addition to random rounding, area suppression has been adopted to further protect the confidentiality of individual responses.

Area suppression is the deletion of all characteristic data for geographic areas with populations below a specified size. The extent to which data are suppressed depends upon the following factors:

- If the data are tabulated from the 100% database, the data are suppressed if the total population in the area is less than 40.
- If the data are tabulated from the 20% sample database, the data are suppressed if the total non-institutional population in the area from either the 100% or 20% databases is less than 40.

There are some exceptions to these rules:

- Income distributions and related statistics are suppressed if the total non-institutional population in the area from either the 100% or 20% databases is less than 250.
- If the data are tabulated from the 100% database and refer to six-character postal codes, the data are suppressed if the total population in the area is less than 100.
- If the data are tabulated from the 20% sample database and refer to six-character postal codes, the data are suppressed if the total non-institutional population in the area from either the 100% or 20% databases is less than 100.

For Place of Work tabulations, suppression is required where the labour force working in an area is less than 40. For Place of Work tables containing both residence and

work locations, both standard suppression rules and location of work suppression rules are applied. In all cases, suppressed data are included in the appropriate higher aggregate subtotals or totals. The suppression technique is being implemented for all products involving subprovincial data (i.e. Profile series, basic summary tabulations, semi-custom and custom data products) collected on a 100% or 20% sample basis. With cell suppression, the minimum acceptable value for a cell is specified. All cell values below the designated cut-off are deleted and replaced by zeros. However, the suppressed data are included in the appropriate higher aggregate subtotals and totals. For further information on the quality of census data, contact the Social Survey Methods Division at Statistics Canada, Ottawa, Ontario, Canada K1A 0T6, or by dialing (613) 951-6934.

Special Notes

Cautionary note for Indian Registration, Aboriginal Identity and Indian Band Membership

In the 1996 Census, taken in May 1996, some 488,000 persons reported being registered under the Indian Act of Canada. This figure is about 19% lower than the Indian Register count (601,000) of May 1996 published by the Department of Indian Affairs and Northern Development (DIAND). The difference between the census and the DIAND figures may be explained by several factors pertinent to each data source. For the 1996 Census, these factors are:

- Missing information because of the fact that there were 77 Indian reserves and Indian settlements not included in the census count. These were Indian reserves and settlements where enumeration was not permitted, was interrupted, occurred too late, or where the quality of the data collected was considered inadequate. The population of these incompletely enumerated Indian reserves and settlements is estimated by Statistics Canada to have been about 44,000 in May 1996.
- The undercoverage of the population residing on enumerated Indian reserves and in enumerated Indian settlements as well as the undercoverage of registered Indians living off Indian reserves and settlements.
- Other factors, such as the exclusion of institutional residents from the census count and the exclusion from the census figure of any registered Indians who were in the United States or overseas at the time of the census, also have a downward impact on the census count relative to the DIAND count.

Any use of the census-based Indian registration data must take into account the incomplete coverage of the total registered Indian population. Furthermore, because of the very close link between Indian registration and Indian Band membership, caution should also be used in interpreting data reported for Indian Band/First Nation membership. The same is true, although to a lesser extent, for the interpretation of Aboriginal identity data for North American Indians.

Nevertheless, the Indian registration, Indian Band and Aboriginal identity data, when combined with other demographic and socio-economic information from the census, contribute to the overall portrait of the Aboriginal population throughout the various regions of Canada.

Incompletely Enumerated Indian Reserves and Indian Settlements

On some Indian reserves and Indian settlements in the 1996 Census, enumeration was not permitted, or was interrupted before it could be completed. Moreover, for some Indian reserves and Indian settlements, the quality of the collected data was considered inadequate. These geographic areas (a total of 77) are called incompletely enumerated Indian reserves and Indian settlements.

Data for 1996 are therefore not available for the incompletely enumerated reserves and settlements and are not included in tabulations. Data for geographic areas containing one or more of these reserves and settlements are therefore noted accordingly. Because of the missing data, users are cautioned that for the affected geographic areas, comparisons (e.g., percentage change) between 1991 and 1996 are not exact. While for higher level geographic areas (Canada, provinces, census metropolitan areas and census agglomerations) the impact of the missing data is very small, the impact can be significant for smaller areas, where the affected reserves and settlements account for a higher proportion of the population.

It was possible after the census to obtain population and dwelling counts for the Wendake (Quebec) Indian reserve. These certified counts amount to 1,462 persons and 563 occupied private dwellings. These numbers are not included in the census population and dwelling counts, since they were established after the census using a different methodology.

A list of incompletely enumerated Indian reserves and Indian settlements along with Population and Occupied Private Dwelling Counts from the last two censuses (where available) has been compiled and is shown in Appendix 1.

A list of incompletely enumerated Indian reserves and Indian settlements is shown in Appendix 2 together with the province, census division and, where applicable, the census metropolitan area or census agglomeration (CMA/CA) in which each is located.

Non-permanent Residents

In 1991 and 1996, the Census of Population enumerated both permanent and non-permanent residents of Canada. Non-permanent residents are persons who held a student or employment authorization, Minister's permit or who were refugee claimants, as well as family members living with them, at the time of the Census.

Prior to 1991, only permanent residents of Canada were included in the census. (The only exception to this occurred in 1941.) Non-permanent residents were considered foreign residents and were not enumerated.

Today in Canada, non-permanent residents make up a significant segment of the population, especially in several census metropolitan areas. Their presence can affect the demand for such government services as health care, schooling, employment programs and language training. The inclusion of non-permanent residents in the census facilitates comparisons with provincial and territorial statistics (marriages, divorces, births and deaths) which include this population. In addition, this inclusion of non-permanent residents brings Canadian practice closer to the UN recommendation that long-term residents (persons living in a country for one year or longer) be enumerated in the census.

According to the 1991 Census, there were 223,410 non-permanent residents in Canada, representing slightly less than 1% of the total population. There were fewer non-permanent residents in Canada at the time of the 1996 Census: 166,715 non-permanent residents or .6% of the total population in 1996.

Total population counts, as well as counts for all variables, are affected by this change in the census universe. Users should be especially careful when comparing data from 1991 or 1996 with data from previous censuses in geographic areas where there is a concentration of non-permanent residents. These include the major metropolitan areas in Ontario, Quebec and British Columbia.

Although every attempt has been made to enumerate non-permanent residents, factors such as language difficulties and the reluctance to complete a government form or understand the need to participate may have affected the enumeration of this population and resulted in undercounting.

Population Counts Based on Usual Residence

The population counts shown here for a particular area represent the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered "non-permanent residents" (see Special Note on this group). In most areas, there is little difference between the number of usual residents and the number of people staying in the area on Census Day. For certain places, however, such as tourist or vacation areas, or those including large work camps, the number of people staying in the area at any particular time could significantly exceed the number of usual residents shown here.

Structural Type of Dwelling

Movable dwellings, one category of structural type of dwellings, were suspected to be under reported in the 1996 Census. This is thought to be due to the misclassification of a number of Mobile Homes as other structural types. For large geographic areas, this error is not expected to have a significant impact upon other dwelling categories because of the relatively large number of dwellings in that area. However, for small geographic areas, the impact may be more pronounced.

Temporary Residents

Unlike previous censuses, the Temporary Residents Study was not carried out in 1996. Therefore, the census did not verify, on a sample basis, if temporary residents (persons found on Census Day at a place other than their usual place of residence) were enumerated at their usual place of residence. In the 1991 Census, the number of people included as a result of the Temporary Residents Study was as follows:

| Province/territory | Estimated total | Standard error |
|-----------------------|-----------------|----------------|
| Canada | 92,584 | 2,307 |
| Newfoundland | 2,621 | 344 |
| Prince Edward Island | 323 | 64 |
| Nova Scotia | 3,683 | 517 |
| New Brunswick | 2,459 | 344 |
| Quebec | 16,462 | 985 |
| Ontario | 30,920 | 1,379 |
| Manitoba | 4,098 | 412 |
| Saskatchewan | 4,808 | 452 |
| Alberta | 11,092 | 829 |
| British Columbia | 15,330 | 943 |
| Yukon Territory | 345 | 89 |
| Northwest Territories | 443 | 96 |

Définitions

Activités sur le marché du travail : Travail en 1995 (variable dérivée)

Variable indiquant le nombre de semaines au cours desquelles les personnes ont travaillé contre rémunération ou à leur compte, en 1995, pour l'ensemble des emplois occupés, ne serait-ce que pour quelques heures, et si ces semaines étaient travaillées surtout à plein temps (30 heures ou plus par semaine) ou à temps partiel (moins de 30 heures par semaine). Les données portent sur les personnes âgées de 15 ans et plus, à l'exclusion des pensionnaires d'un établissement institutionnel.

Sont comprises les semaines de vacances payées, de congés de maladie ou d'absences payées par l'employeur pour suivre des cours de formation. Les personnes qui ont travaillé moins d'une année, mais qui étaient rémunérées pour une période de 12 mois, comme les enseignants devaient inscrire 52 semaines. Les personnes qui ont exploité une ferme ou une entreprise ou ont exercé une profession pendant toute l'année, incluant les semaines de vacances devaient aussi inscrire 52 semaines.

L'expression «personnes ayant travaillé toute l'année à plein temps» désigne les personnes âgées de 15 ans et plus, à l'exclusion des pensionnaires d'un établissement institutionnel, qui ont travaillé, contre rémunération ou à leur compte, de 49 à 52 semaines à plein temps durant l'année de référence.

Circonscription électorale fédérale (CÉF) :

Une circonscription électorale fédérale est un endroit ou un territoire pour lequel les habitants sont en droit d'élire un député à la Chambre des communes (source : Loi électorale du Canada, 1990). Selon l'Ordonnance de représentation de 1987, il y a 295 CÉF au Canada et selon l'Ordonnance de représentation de 1996, il y a 301 CÉF au Canada.

Famille économique

Groupe de deux personnes ou plus qui vivent dans le même logement et qui sont apparentées par le sang, par alliance, par union libre ou par adoption.

Définition supplémentaire

Pour former une famille économique, les membres d'un ménage doivent être apparentés par le sang, par alliance, par union libre ou par adoption. En revanche, pour former une famille de recensement, les membres d'une famille doivent nécessairement être un conjoint et une conjointe, des partenaires en union libre de sexe opposé ou un

parent seul vivant avec un fils ou une fille jamais marié. Par conséquent, la famille économique peut comprendre un plus grand nombre de personnes que la famille de recensement. Par exemple, une veuve vivant avec son fils et sa bru est considérée comme une personne hors famille, selon la définition de famille de recensement, mais fait partie de la famille économique incluant son fils et sa bru. De même, deux ou plusieurs familles apparentées vivant ensemble constituent une famille économique (par exemple, un homme et son épouse vivant avec leur fils et leur bru). Deux ou plusieurs frères ou sœurs vivant ensemble, sans leur(s) parent(s), forment une famille économique, mais non une famille de recensement puisqu'ils ne répondent pas à la définition de cette dernière. Tous les membres d'une famille de recensement appartiennent également à une famille économique.

Ménage privé

Personne ou groupe de personnes (autres que des résidents étrangers) occupant un logement privé et n'ayant pas de domicile habituel ailleurs au Canada

Personne hors famille économique

Membre d'un ménage qui n'appartient pas à une famille économique. Une personne hors famille économique peut soit vivre seule, soit faire partie d'un ménage avec les membres duquel elle n'a aucun lien de parenté. Des statistiques sur le revenu sont générées pour les personnes hors famille économique âgées d'au moins 15 ans.

Revenu : Composition du revenu

La composition du revenu total d'un groupe au sein d'une population ou d'une région géographique correspond à la part relative que représente chaque source de revenu ou groupe de sources de revenu, exprimée en pourcentage du revenu agrégé de ce groupe ou de cette région.

Revenu : Fréquence des unités à faible revenu

Proportion ou pourcentage de familles économiques ou de personnes hors famille économique dans une catégorie donnée dont le revenu est inférieur aux seuils de faible revenu. Ces taux de fréquence sont calculés d'après des estimations non arrondies des familles économiques et des personnes hors famille économique âgées de 15 ans et plus. Comme tous les membres d'une famille économique sont dans la même situation, la fréquence des unités à faible revenu peut également être calculée pour la population dans les ménages privés.

Catégorie de revenu

Situation de la famille économique ou de la personne hors famille économique âgée de 15 ans et plus par rapport aux seuils de faible revenu (SFR) de Statistique Canada.

Seuils de faible revenu (SFR)

Les mesures du faible revenu appelées seuils de faible revenu (SFR) ont été établies pour la première fois au Canada en 1968, d'après les données sur le revenu du recensement de 1961 et les régimes de dépenses des familles en 1959. À cette époque, les régimes de dépenses indiquaient que les familles canadiennes consacraient environ 50 % de leur revenu à la nourriture, au logement et à l'habillement. On a arbitrairement estimé que les familles consacrant 70 % ou plus de leur revenu à ces biens de première nécessité sont «dans le besoin». À partir de cette hypothèse, des seuils de faible revenu ont été établis pour cinq différentes tailles de famille.

Par la suite, les seuils de faible revenu ont été révisés d'après les données nationales sur les dépenses des familles pour 1969, 1978, 1986 et 1992. Selon ces données, les familles canadiennes consacraient en moyenne 42 % de leur revenu aux biens de première nécessité en 1969, contre 38,5 % en 1978, 36,2 % en 1986 et 34,7 % en 1992. En ajoutant la différence initiale de 20 points au niveau de base des dépenses au titre des biens de première nécessité, de nouveaux seuils de faible revenu ont été fixés selon la taille de la famille et le degré d'urbanisation. Depuis, ces seuils de faible revenu ont été mis à jour chaque année d'après les changements subis par l'indice des prix à la consommation.

Dans la publication du recensement de 1991 intitulée «Certaines statistiques du revenu», n° 93-331 au Catalogue, les données sur la fréquence des unités à faible revenu de 1990 ont été publiées selon les seuils révisés de 1992 et ajustées d'après les changements subis par l'indice des prix à la consommation. Il ne sera pas possible de comparer ces données à celles du recensement de 1996 puisque les SFR ont depuis été révisées.

Revenu : Revenu d'emploi/Gains

Revenu total reçu en 1995 par les personnes âgées de 15 ans et plus sous forme de :

Salaires et traitements

Salaires et traitements bruts avant les retenues pour l'impôt sur le revenu, les cotisations à un régime de pensions et au programme d'assurance-chômage. Sont compris les soldes et les indemnités militaires, les pourboires, les commissions, les gratifications et les

gains provenant de tout genre d'emploi occasionnel réalisés durant l'année civile 1995. Est exclue la valeur des allocations et avantages imposables fournis gratuitement par l'employeur tels que le logement ou l'utilisation d'un véhicule automobile.

Revenu non agricole net dans une entreprise non constituée en société et/ou dans l'exercice d'une profession

Revenu net (recettes brutes moins les dépenses d'exploitation, telles que les salaires, les loyers, l'amortissement) provenant de l'exploitation d'une entreprise non agricole non constituée en société ou de l'exercice d'une profession pour son propre compte, durant l'année civile 1995. Dans le cas d'une association, le recensé devait déclarer seulement sa propre part du revenu. Sont inclus également le revenu net des personnes qui gardent des enfants à leur propre domicile, celui des pêcheurs, chasseurs et trappeurs qui travaillent à leur compte, celui des exploitants d'entreprises de distribution directe, par exemple des entreprises de vente et de livraison de produits de beauté, ainsi que le revenu que les artistes, les écrivains, les professeurs de musique, les coiffeurs et coiffeuses, les couturiers et couturières, etc., tirent de leurs activités autonomes.

Revenu agricole net

Revenu net (recettes brutes provenant de la vente de produits agricoles, moins l'amortissement et les frais d'exploitation) tiré de l'exploitation d'une ferme, pour son propre compte ou en association, durant l'année civile 1995. Dans le cas d'une association, le recensé devait déclarer seulement sa propre part du revenu. Sont inclus dans le revenu net les avances en espèces, les dividendes reçus de coopératives, le produit brut des assurances, et les remises et les paiements dans le cadre de programmes fédéraux, provinciaux et régionaux de soutien aux entreprises agricoles (par exemple, les subventions à la production laitière et les paiements reçus d'offices de mise en marché). Par contre, la valeur du revenu en nature, comme les produits agricoles cultivés et consommés à la ferme, n'est pas incluse.

Définition supplémentaire

Revenu moyen des particuliers

Revenu total moyen pondéré des personnes âgées de 15 ans et plus qui ont déclaré un revenu. Pour établir le revenu moyen à partir des données non arrondies, il faut diviser le revenu agrégé d'un groupe de particuliers donné (par exemple, les hommes de 45 à 54 ans) par le nombre de personnes qui ont déclaré un revenu dans ce groupe.

Ce concept et cette procédure s'appliquent au revenu total, au revenu d'emploi, aux salaires et traitements et à n'importe quelle autre composante du revenu.

Revenu médian des particuliers

Valeur centrale séparant en deux parties égales la répartition par tranches de revenu d'un groupe donné de personnes ayant un revenu; la première partie regroupe les personnes ayant un revenu inférieur à la médiane, et la seconde, les personnes ayant un revenu supérieur à la médiane.

Ce concept et cette procédure s'appliquent au revenu total, au revenu d'emploi, aux salaires et traitements et à n'importe quelle autre composante du revenu.

Erreur type du revenu moyen

Estimation de l'erreur type du revenu moyen pour une répartition par tranches de revenu. Si elle est interprétée de la façon décrite ci-après, elle sert d'indicateur grossier de la précision avec laquelle le revenu moyen a été estimé. Pour environ 68 % des échantillons qui peuvent être tirés de la base de sondage, la différence entre l'estimation du revenu moyen calculée pour un échantillon et le chiffre correspondant obtenu par un dénombrement exhaustif est inférieure à une erreur type. Pour près de 95 % des échantillons possibles, la différence est de moins de deux erreurs types et dans environ 99 % des échantillons, elle est inférieure à environ deux fois et demie l'erreur type.

Revenu : Revenu total

Revenu total en espèces, reçu par les personnes âgées de 15 ans et plus durant l'année civile 1995, provenant des sources suivantes :

- salaires et traitements (total);
- revenu agricole net;
- revenu non agricole net dans une entreprise non constituée en société et/ou dans l'exercice d'une profession;
- prestations fiscales fédérales pour enfants;
- pension de sécurité de la vieillesse et supplément de revenu garanti;
- prestations du Régime de rentes du Québec ou du Régime de pensions du Canada;
- prestations d'assurance-chômage;
- autre revenu provenant de sources publiques;
- dividendes, intérêts d'obligations, de dépôts et de certificats d'épargne, et autre revenu de placements;
- pensions de retraite et rentes, y compris les rentes de REÉR et de FERR;
- autre revenu en espèces.

Recettes non comptées comme revenu

Le concept de revenu exclut les gains et les pertes au jeu, les sommes reçues en héritage au cours de l'année, les gains et les pertes en capital, les recettes de la vente d'une propriété ou de biens personnels, les

remboursements d'impôt sur le revenu, les paiements de prêt reçus ou remboursés, les règlements monétaires forfaitaires d'assurance, les remboursements d'impôt foncier et autres taxes, les remboursements de cotisations à un régime de pensions ainsi que les revenus en nature tels que les repas et l'hébergement gratuits ou les produits agricoles cultivés et consommés à la ferme.

Revenu moyen des particuliers

Revenu total moyen pondéré des personnes âgées de 15 ans et plus qui ont déclaré un revenu. Pour établir le revenu moyen à partir des données non arrondies, il faut diviser le revenu agrégé d'un groupe de particuliers donné (par exemple, les hommes de 45 à 54 ans) par le nombre de personnes qui ont déclaré un revenu dans ce groupe.

Ce concept et cette procédure s'appliquent au revenu total, au revenu d'emploi, aux salaires et traitements et à n'importe quelle autre composante du revenu.

Revenu médian des particuliers

Valeur centrale séparant en deux parties égales la répartition par tranches de revenu d'un groupe donné de personnes ayant un revenu; la première partie regroupe les personnes ayant un revenu inférieur à la médiane, et la seconde, les personnes ayant un revenu supérieur à la médiane.

Ce concept et cette procédure s'appliquent au revenu total, au revenu d'emploi, aux salaires et traitements et à n'importe quelle autre composante du revenu.

Erreur type du revenu moyen

Estimation de l'erreur type du revenu moyen pour une répartition par tranches de revenu. Si elle est interprétée de la façon décrite ci-après, elle sert d'indicateur grossier de la précision avec laquelle le revenu moyen a été estimé. Pour environ 68 % des échantillons qui peuvent être tirés de la base de sondage, la différence entre l'estimation du revenu moyen calculée pour un échantillon et le chiffre correspondant obtenu par un dénombrement exhaustif est inférieure à une erreur type. Pour près de 95 % des échantillons possibles, la différence est de moins de deux erreurs types et dans environ 99 % des échantillons, elle est inférieure à environ deux fois et demie l'erreur type.

Revenu : Revenu total de la famille de recensement

Somme des revenus totaux de tous les membres d'une famille de recensement donnée.

Revenu total

Revenu total en espèces, reçu par les personnes âgées de 15 ans et plus durant l'année civile 1995, provenant des sources suivantes :

- salaires et traitements (total);
- revenu agricole net;
- revenu non agricole net dans une entreprise non constituée en société et/ou dans l'exercice d'une profession;
- prestations fiscales fédérales pour enfants;
- pension de sécurité de la vieillesse et supplément de revenu garanti;
- prestations du Régime de rentes du Québec ou du Régime de pensions du Canada;
- prestations d'assurance-chômage;
- autre revenu provenant de sources publiques;
- dividendes, intérêts d'obligations, de dépôts et de certificats d'épargne, et autre revenu de placements;
- pensions de retraite et rentes, y compris les rentes de REÉR et de FERR;
- autre revenu en espèces.

Recettes non comptées comme revenu

Le concept de revenu exclut les gains et les pertes au jeu, les sommes reçues en héritage au cours de l'année, les gains et les pertes en capital, les recettes de la vente d'une propriété ou de biens personnels, les remboursements d'impôt sur le revenu, les paiements de prêt reçus ou remboursés, les règlements monétaires forfaitaires d'assurance, les remboursements d'impôt foncier et autres taxes, les remboursements de cotisations à un régime de pensions ainsi que les revenus en nature tels que les repas et l'hébergement gratuits ou les produits agricoles cultivés et consommés à la ferme.

Revenu moyen des familles de recensement et des personnes hors famille de recensement de 15 ans et plus

Revenu total moyen pondéré des familles de recensement.

Pour calculer le revenu moyen à partir de données non arrondies, il faut diviser le revenu agrégé d'un groupe de familles donné (par exemple, les familles époux-épouse dans lesquelles l'épouse travaille) par le nombre de familles dans ce groupe, qu'un revenu ait été déclaré ou non. De même, pour calculer le revenu moyen d'un groupe de personnes hors famille de recensement à partir de données non arrondies, on divise le revenu agrégé du groupe en question par le nombre de personnes hors famille de recensement de 15 ans et plus dans ce groupe, qu'un revenu ait été déclaré ou non.

Revenu médian des familles de recensement et des personnes hors famille de recensement de 15 ans et plus

Valeur centrale séparant en deux parties égales la répartition par tranches de revenu d'un groupe donné de familles de recensement ou de personnes hors famille de recensement de 15 ans et plus; la première partie regroupe les unités ayant un revenu inférieur à la médiane, et la seconde, les unités ayant un revenu supérieur à la médiane.

Le revenu médian des familles de recensement et des personnes hors famille de recensement est calculé pour toutes les unités comprises dans le groupe donné, qu'un revenu ait été déclaré ou non.

Erreur type du revenu moyen

Estimation de l'erreur type du revenu moyen pour une répartition par tranches de revenu. Si elle est interprétée de la façon décrite ci-après, elle sert d'indicateur grossier de la précision avec laquelle le revenu moyen a été estimé. Pour environ 68 % des échantillons qui peuvent être tirés de la base de sondage, la différence entre l'estimation du revenu moyen calculée pour un échantillon et le chiffre correspondant obtenu par un dénombrement exhaustif est inférieure à une erreur type. Pour près de 95 % des échantillons possibles, la différence est de moins de deux erreurs types et dans environ 99 % des échantillons, elle est inférieure à environ deux fois et demie l'erreur type.

Revenu : Revenu total du ménage

Somme des revenus totaux de tous les membres du ménage.

Revenu total

Revenu total en espèces, reçu par les personnes âgées de 15 ans et plus durant l'année civile 1995, provenant des sources suivantes :

- salaires et traitements (total);
- revenu agricole net;
- revenu non agricole net dans une entreprise non constituée en société et/ou dans l'exercice d'une profession;
- prestations fiscales fédérales pour enfants;
- pension de sécurité de la vieillesse et supplément de revenu garanti;
- prestations du Régime de rentes du Québec ou du Régime de pensions du Canada;
- prestations d'assurance-chômage;
- autre revenu provenant de sources publiques;
- dividendes, intérêts d'obligations, de dépôts et de certificats d'épargne, et autre revenu de placements;

- pensions de retraite et rentes, y compris les rentes de REÉR et de FERR;
- autre revenu en espèces.

Recettes non comptées comme revenu

Le concept de revenu exclut les gains et les pertes au jeu, les sommes reçues en héritage au cours de l'année, les gains et les pertes en capital, les recettes de la vente d'une propriété ou de biens personnels, les remboursements d'impôt sur le revenu, les paiements de prêt reçus ou remboursés, les règlements monétaires forfaitaires d'assurance, les remboursements d'impôt foncier et autres taxes, les remboursements de cotisations à un régime de pensions ainsi que les revenus en nature tels que les repas et l'hébergement gratuits ou les produits agricoles cultivés et consommés à la ferme.

Revenu moyen des ménages

Revenu total moyen pondéré des ménages.

Pour calculer le revenu moyen à partir de données non arrondies, il faut diviser le revenu agrégé d'un groupe de ménages donné (par exemple, les ménages familiaux) par le nombre de ménages dans ce groupe, qu'un revenu ait été déclaré ou non.

Revenu médian des ménages

Valeur centrale séparant en deux parties égales la répartition par tranches de revenu d'un groupe donné de ménages; la première partie regroupe les unités ayant un revenu inférieur à la médiane, et la seconde, les unités ayant un revenu supérieur à la médiane.

Le revenu médian des ménages est calculé pour toutes les unités comprises dans le groupe, qu'un revenu ait été déclaré ou non.

Erreur type du revenu moyen

Estimation de l'erreur type du revenu moyen pour une répartition par tranches de revenu. Si elle est interprétée de la façon décrite ci-après, elle sert d'indicateur grossier de la précision avec laquelle le revenu moyen a été estimé. Pour environ 68 % des échantillons qui peuvent être tirés de la base de sondage, la différence entre l'estimation du revenu moyen calculée pour un échantillon et le chiffre correspondant obtenu par un dénombrement exhaustif est inférieure à une erreur type. Pour près de 95 % des échantillons possibles, la différence est de moins de deux erreurs types et dans environ 99 % des échantillons, elle est inférieure à environ deux fois et demie l'erreur type.

Sexe

Qualité d'homme ou de femme.

Situation des particuliers dans la famille de recensement

Classement des personnes selon qu'elles appartiennent ou non à une famille de recensement

Membres d'une famille de recensement – Membres d'un ménage qui appartiennent à une famille de recensement.

Personnes hors famille de recensement – Membres d'un ménage qui ne font pas partie d'une famille de recensement. Ils peuvent être apparentés à la Personne 1, personne repère du ménage (p. ex., frère divorcé, beau-frère, cousine ou grand-père de la Personne 1), ou non apparentés (p. ex., chambreur, colocataire ou employé). Les personnes qui vivent seules sont toujours considérées comme des personnes hors famille de recensement.

Structure de la famille de recensement

Classement des familles de recensement en familles comptant un couple actuellement marié (avec ou sans fils et/ou filles jamais mariés des deux conjoints ou de l'un d'eux), en familles comptant un couple en union libre (avec ou sans fils et/ou filles jamais mariés des deux partenaires ou de l'un d'eux) et en familles monoparentales selon le sexe du parent.

Définition supplémentaire

Les familles comptant un couple actuellement marié et les familles comptant un couple en union libre constituent les «familles époux-épouse».

Taille du ménage

Nombre de personnes dans un ménage privé.

Qualité des données

Généralités

Le recensement de 1996 a été une entreprise complexe et de grande envergure. Bien que l'on ait déployé des efforts considérables pour assurer le respect des normes élevées tout au cours des opérations de la collecte et du traitement, il est inévitable que les estimations résultantes soient entachées d'erreurs. Il faut que les utilisateurs des données du recensement sachent que ces erreurs existent et qu'ils aient une idée générale de

ses principales composantes afin d'être en mesure de déterminer si les données produites peuvent leur être utiles et d'évaluer les risques auxquels ils s'exposent en tirant des conclusions ou en prenant des décisions à partir de ces données.

Des erreurs peuvent se produire pratiquement à toutes les étapes du recensement, depuis la préparation des documents jusqu'au traitement des données, en passant par l'établissement des listes de logements et la collecte des données. Certaines erreurs, qui surviennent plus ou moins au hasard, ont tendance à s'annuler lorsque les réponses fournies par les divers répondants sont agrégées pour un groupe assez important. Dans le cas des erreurs de cette nature, l'estimation correspondante sera d'autant plus précise que le groupe visé sera grand. C'est pourquoi on conseille aux utilisateurs de faire preuve de prudence lorsqu'ils utilisent des estimations relatives à de petits groupes. Toutefois, certaines erreurs peuvent survenir de façon plus systématique et introduire un «biais» dans les estimations. Comme ce biais persiste quelle que soit la taille du groupe pour lequel les réponses sont agrégées et comme il est particulièrement difficile d'en mesurer l'importance, les erreurs systématiques posent pour la plupart des utilisateurs de données des problèmes plus graves que les erreurs aléatoires mentionnées plus haut.

En ce qui concerne les données du recensement en général, les principaux types d'erreur sont les suivants :

- **les erreurs de couverture** qui se produisent lorsqu'on oublie des logements et/ou des personnes, qu'on les englobe à tort ou qu'on les compte deux fois;
- **les erreurs dues à la non-réponse** qui surviennent lorsque l'on n'a pu obtenir de réponses d'un petit nombre de ménages et/ou de personnes en raison d'une absence prolongée ou pour toute autre raison;
- **les erreurs de réponse** qui surviennent lorsque le répondant, ou parfois le recenseur, a mal interprété une question du recensement et a inscrit une mauvaise réponse;
- **les erreurs de traitement** qui peuvent se produire à diverses étapes, notamment au codage, lorsque les réponses en lettres sont converties en codes numériques; à la saisie des données, lorsque les préposés à l'entrée des données transfèrent sur bandes pour ordinateur les réponses figurant au questionnaire du recensement; à l'imputation, lorsqu'une réponse «valide», mais pas nécessairement exacte, est insérée dans un enregistrement par l'ordinateur pour remplacer une réponse manquante ou «invalidé» («valide» et «invalidé» renvoient à la cohérence de la réponse, compte tenu des autres renseignements compris dans l'enregistrement);
- **les erreurs d'échantillonnage** qui s'appliquent uniquement aux questions supplémentaires figurant dans le questionnaire complet distribué à un échantillon de un cinquième des ménages; elles résultent du fait que les réponses à ces questions, une fois pondérées pour représenter l'ensemble de la population, diffèrent inévitablement des résultats que l'on aurait obtenus si l'on avait posé ces questions à tous les ménages.

Les types d'erreur mentionnés plus haut ont tous une composante aléatoire et une composante systématique. Toutefois, la composante systématique de l'erreur d'échantillonnage est d'ordinaire très petite comparativement à sa composante aléatoire. Dans le cas des autres erreurs non dues à l'échantillonnage, tant la composante aléatoire que la composante systématique peuvent être importantes.

Erreurs de couverture

Les erreurs de couverture ont une incidence directe sur la précision des chiffres du recensement, c'est-à-dire sur la taille des divers univers du recensement : la population, les familles, les ménages et les logements. Bien que des mesures aient été prises pour corriger certaines erreurs identifiables, les chiffres définitifs sont toujours entachés d'une certaine erreur découlant du fait que des personnes ou des logements ont été oubliés, englobés à tort dans le recensement ou comptés deux fois.

L'oubli de logements ou de personnes se traduit par un **sous-dénombrement**. Des logements peuvent être oubliés en raison d'une mauvaise interprétation des limites du secteur de dénombrement (SD), ou du fait que ces logements n'ont pas l'apparence de logements ou semblent inhabitables. Des personnes peuvent être oubliées parce que leur logement est oublié ou classé comme inoccupé, ou quand certains membres du ménage sont omis sur le questionnaire parce que le répondant a mal interprété les instructions concernant les personnes à inclure. Enfin, certaines personnes peuvent être oubliées parce qu'elles n'ont pas de domicile habituel et qu'elles n'ont pas passé la nuit du recensement dans un logement.

Le dénombrement à tort ou le double compte de logements ou de personnes se traduit par un **surdénombrement**. Il peut y avoir surdénombrement des logements lorsque des constructions impropres à l'habitation sont classées comme logements ou lorsque des unités d'habitation ne répondant pas à la définition du logement retenue pour les fins du recensement sont comptées séparément plutôt que d'être considérées comme faisant partie d'un logement plus grand. Il peut y avoir double compte des logements lorsqu'il existe une certaine ambiguïté au sujet des limites des SD. Les

personnes peuvent être comptées deux fois parce que leur logement a été compté deux fois ou parce que les lignes directrices concernant les personnes à inscrire dans le questionnaire ont été mal interprétées. À l'occasion, il arrive qu'une personne ne faisant pas partie de l'univers de la population du recensement, comme un résident étranger ou une personne fictive, soit dénombrée à tort. En moyenne, le surdénombrement est moins susceptible de se produire que le sous-dénombrement; les chiffres des logements et des personnes sont donc probablement légèrement sous-estimés.

En 1996, trois études permettent de mesurer l'erreur de couverture. Dans le contexte de la vérification des logements inoccupés, on a de nouveau visité un échantillon de logements classés comme inoccupés afin de vérifier s'ils étaient réellement inoccupés le jour du recensement. Les chiffres définitifs du recensement ont ensuite été corrigés pour tenir compte des personnes ou des ménages oubliés du fait que leur logement avait été classé par erreur comme inoccupé. En dépit de ces ajustements, les chiffres définitifs peuvent tout de même être entachés d'un certain sous-dénombrement. Le sous-dénombrement tend à être plus élevé pour certains segments de la population comme les jeunes adultes de sexe masculin et les personnes récemment immigrées. La contre-vérification des dossiers permet de mesurer le sous-dénombrement résiduel pour le Canada, de même que pour chaque province et chaque territoire. L'étude du surdénombrement a pour objet d'étudier les erreurs de surdénombrement. Ensemble, les résultats de la contre-vérification des dossiers et de l'étude du surdénombrement fournissent une estimation du sous-dénombrement net.

Autres erreurs non dues à l'échantillonnage

Alors que les erreurs de couverture ont une incidence sur le nombre d'unités comprises dans les divers univers du recensement, d'autres erreurs influent sur les caractéristiques de ces unités.

Il est parfois impossible d'obtenir une réponse complète d'un ménage, même si le logement a été classé comme étant occupé et un questionnaire a été livré. Il se peut que les membres du ménage aient été absents pendant toute la période du recensement ou, en de rares occasions, que le membre responsable du ménage ait refusé de remplir le questionnaire. Il arrive plus souvent que le questionnaire soit retourné, mais qu'il y manque des données à certaines questions ou pour certaines personnes. Des efforts considérables sont déployés afin d'obtenir une réponse la plus complète possible. Les recenseurs contrôlent les questionnaires et assurent un suivi à l'égard de l'information manquante. Le travail du recenseur est ensuite vérifié tant par un surveillant que par un technicien du contrôle qualitatif. Malgré tout, il existe toujours un petit nombre de réponses manquantes

à la fin de l'étape de la collecte. Bien que les entrées manquantes soient éliminées en cours de traitement en remplaçant chaque valeur manquante par la valeur correspondante figurant dans un enregistrement «similaire», il est possible que certaines **erreurs de non-réponse** s'y glissent. Cela est particulièrement grave lorsque les personnes non répondantes diffèrent des répondants sous certains aspects; en effet, cette procédure se traduira par l'introduction d'un biais de non-réponse.

Même lorsqu'une réponse est obtenue, il se peut qu'elle ne soit pas tout à fait exacte. Il est possible que le répondant ait mal interprété la question ou ait donné une réponse au jugé, surtout lorsqu'il répondait pour le compte d'un autre membre du ménage, qui était peut-être absent. Ces erreurs sont désignées sous le nom **d'erreurs de réponse**. Bien que ces erreurs surviennent d'ordinaire du fait que les répondants aient fourni des renseignements inexacts, elles peuvent aussi résulter d'erreurs commises par les recenseurs en remplissant certaines parties du questionnaire, comme le type de construction résidentielle, ou au moment du rappel effectué pour obtenir une réponse manquante.

Certaines questions du questionnaire du recensement nécessitent une réponse en lettres. Pendant le traitement, on attribue un code numérique à ces réponses. Il est possible que des **erreurs de codage** se produisent lorsque la réponse écrite est ambiguë, incomplète ou difficile à lire, ou lorsque la liste des codes est longue (p. ex., principal domaine d'études, lieu de travail). L'étape formelle du contrôle qualitatif (CQ) permet de cerner et de rectifier les erreurs de codage et d'en réduire le nombre. À l'intérieur de chaque unité de travail, un échantillon des réponses est codé indépendamment une deuxième fois. La résolution des incohérences entre les premier et deuxième codages détermine la nécessité, s'il y a lieu, de coder à nouveau l'unité de travail. Exception faite pour le codage des variables de l'industrie et de la profession, la plupart des tâches de codage du recensement sont maintenant automatisées, en partie pour tenter de réduire le nombre d'erreurs de codage.

Les renseignements figurant dans les questionnaires sont introduits sur clavier dans un fichier informatique. Deux méthodes de résolution ordonnée sont utilisées pour limiter le nombre **d'erreurs à la saisie des données**. Dans un premier temps, certains contrôles (comme des vérifications d'étendue) sont effectués à mesure que les données sont entrées. Dans un second temps, on introduit de nouveau sur clavier un échantillon tiré de chaque lot de documents, puis on compare les entrées résultantes aux entrées initiales. Le travail non satisfaisant est ainsi circonscrit et corrigé et, si cela est nécessaire, le reste du lot est de nouveau introduit au clavier.

Une fois saisies, les données font l'objet de vérifications qui consistent à les soumettre à une série de contrôles informatiques visant à relever les réponses manquantes ou incohérentes. À l'étape de l'imputation, on substitue à ces dernières des réponses déduites à partir des autres données de l'enregistrement ou des réponses tirées d'un enregistrement donneur similaire. L'imputation permet d'obtenir une base de données complète dont les données correspondent aux chiffres du recensement et facilitent les analyses multidimensionnelles. Même si des erreurs peuvent être introduites à l'étape de l'imputation, les méthodes utilisées ont fait l'objet de tests rigoureux visant à réduire au minimum les **erreurs systématiques**.

Diverses études sont réalisées afin d'évaluer la qualité des réponses obtenues dans le cadre du recensement de 1996. Ainsi, on a calculé les taux de réponse et les taux de rejet au contrôle pour chaque question. Ces taux peuvent permettre de déterminer le potentiel d'erreur de non-réponse et d'autre type d'erreurs. De même, les totalisations établies à partir des données du recensement de 1996 ont été ou seront comparées avec les estimations correspondantes obtenues à partir des données des recensements précédents, des enquêtes-échantillon (comme l'Enquête sur la population active) et de divers dossiers administratifs (comme les registres des naissances et le cadastre municipal). Ces comparaisons peuvent permettre de cerner les problèmes de qualité éventuels ou, à tout le moins, de relever les divergences entre les sources.

Outre ces comparaisons entre données agrégées, certaines études de couplage de microdonnées sont actuellement menées afin de comparer les réponses de certains particuliers obtenues au recensement à celles d'une autre source de renseignements. Pour un certain nombre de caractéristiques «stables» (comme l'âge, le sexe, la langue maternelle, le lieu de naissance), on compare les réponses obtenues auprès d'un échantillon de personnes à l'occasion du recensement de 1996 aux réponses obtenues des mêmes personnes à l'occasion du recensement de 1991.

Erreurs d'échantillonnage

Les estimations obtenues en pondérant les réponses recueillies auprès d'un échantillon sont susceptibles d'être entachées d'erreurs en raison de la répartition des caractéristiques au sein de l'échantillon, qui n'est généralement pas identique à la répartition correspondante au sein de la population dans laquelle l'échantillon a été prélevé.

L'erreur susceptible d'être introduite par l'échantillonnage variera en fonction de la rareté relative de la caractéristique étudiée au sein de la population. Lorsque la valeur contenue dans la case est élevée, cette erreur

sera relativement faible proportionnellement à cette valeur. Lorsque la valeur contenue dans la case est faible, cette erreur sera relativement importante proportionnellement à cette valeur.

L'erreur susceptible d'être introduite par l'échantillonnage est d'ordinaire exprimée sous forme d'«erreur type». Il s'agit de la racine carrée de la moyenne, calculée pour l'ensemble des échantillons de même taille prélevés selon le même plan d'échantillonnage, des carrés de l'écart de l'estimation obtenue à partir de l'échantillon par rapport à la valeur pour l'ensemble de la population.

Le tableau ci-dessous fournit des mesures approximatives de l'erreur type due à l'échantillonnage. Ces mesures sont données uniquement à titre indicatif.

Erreur type approximative due à l'échantillonnage pour les données-échantillon du recensement de 1996 :

| Valeur contenue dans la case | Erreur type approximative |
|------------------------------|---------------------------|
| 50 ou moins | 15 |
| 100 | 20 |
| 200 | 30 |
| 500 | 45 |
| 1 000 | 65 |
| 2 000 | 90 |
| 5 000 | 140 |
| 10 000 | 200 |
| 20 000 | 280 |
| 50 000 | 450 |
| 100 000 | 630 |
| 500 000 | 1 400 |

Les utilisateurs souhaitant déterminer l'erreur d'échantillonnage approximative pour une case de données dont la valeur a été obtenue à partir de l'échantillon de 20 % doivent choisir l'erreur type correspondant à l'entrée dans la colonne «Valeur contenue dans la case» ci-dessus qui se rapproche le plus de celle qui figure dans la case de données de la totalisation en cause. En utilisant la valeur ainsi obtenue pour l'erreur type, l'utilisateur peut, en général et à juste titre, être certain que la valeur réelle pour la population dénombrée (ne tenant pas compte des formes d'erreur autres que l'erreur d'échantillonnage) ne s'écarte pas de la valeur contenue dans la case dans une proportion supérieure ou inférieure à trois fois l'erreur type (p. ex., si la valeur contenue dans la case est 1 000, la fourchette à l'intérieur de laquelle se situe la valeur réelle serait de $1\,000 \pm (3 \times 65)$ ou de $1\,000 \pm 195$).

Les erreurs types données dans le tableau ci-dessus ne s'appliquent pas aux totaux ou aux totaux partiels relatifs à la population ou aux univers (personnes, ménages, logements ou familles) pour la région géographique

étudiée (voir Échantillonnage et pondération). On peut déterminer l'effet de l'échantillonnage pour ces valeurs en les comparant à celles des publications correspondantes contenant des données intégrales.

Il est à noter que l'effet du plan d'échantillonnage et de la méthode de pondération utilisés dans le cadre du recensement de 1996 variera d'une caractéristique à l'autre et d'une région géographique à l'autre. Il est donc possible que les valeurs de l'erreur type données dans le tableau ci-dessus sous-estiment ou surestiment l'erreur attribuable à l'échantillonnage.

Échantillonnage et pondération

Les données du recensement de 1996 sont soit des données intégrales (c.-à-d. recueillies auprès de l'ensemble des ménages), soit des données-échantillon (c.-à-d. recueillies auprès d'un échantillon aléatoire comprenant un ménage sur cinq) que l'on a pondérées pour obtenir des estimations pour l'ensemble de la population. Les données du présent rapport ont été recueillies auprès d'un échantillon de 20 % et pondérées pour compenser pour l'échantillonnage. Tous les entêtes de tableaux sont annotés en conséquence. On notera que, dans les réserves indiennes et les régions éloignées, toutes les données ont été recueillies auprès de l'ensemble de la population.

Il est possible que, pour une région géographique donnée, le total ou le total partiel pondéré de la population, des ménages, des logements ou des familles diffère du chiffre correspondant figurant dans les publications contenant des données intégrales. Ces variations (en plus de l'effet de l'arrondissement aléatoire) sont attribuables à l'échantillonnage.

Confidentialité et arrondissement aléatoire

Afin de protéger le caractère confidentiel des renseignements fournis, les chiffres indiqués aux tableaux ont fait l'objet d'un arrondissement aléatoire qui supprime toute possibilité d'associer des données statistiques à une personne facilement reconnaissable. Selon cette méthode, tous les chiffres, y compris les totaux et les marges, sont arrondis de façon aléatoire (vers le haut ou vers le bas) jusqu'à un multiple de «5» et, dans certains cas, de «10». Cette technique assure une protection efficace contre la divulgation sans ajouter d'erreur significative dans les données du recensement. Les utilisateurs doivent savoir que les totaux et les marges sont arrondis séparément et qu'ils ne correspondent pas nécessairement à la somme des chiffres arrondis séparément dans les répartitions. De plus, il faut s'attendre à ce que les totaux et les autres chiffres correspondants dans diverses totalisations du recensement présentent quelques légères différences. De même, la somme des pourcentages, qui sont calculés

à partir de chiffres arrondis, ne correspond pas forcément à 100 %. Les répartitions en pourcentage et les taux sont dans la plupart des cas basés sur des données arrondies, alors que les variations en pourcentage et les moyennes sont basées sur des données non arrondies. La distorsion importante pouvant résulter de l'arrondissement aléatoire dans le cas des cases de faible valeur mérite aussi d'être signalée. Cette distorsion peut entraîner une perte de précision pour les cases de données renfermant des chiffres peu élevés.

Les utilisateurs devraient, lors de l'agrégation des données arrondies, être conscients de cette distorsion. Les erreurs dues à l'arrondissement ont tendance à s'annuler lorsque les chiffres contenus dans les cases sont agrégés de nouveau. Cependant, il est possible de réduire les distorsions en intégrant dans la mesure du possible les totaux partiels appropriés dans les totalisations.

Les utilisateurs désirant obtenir un maximum de précision peuvent aussi choisir de demander des totalisations personnalisées. Dans le cas de produits personnalisés, l'agrégation se fait à partir des enregistrements dans la base de données du recensement se rapportant aux particuliers. L'arrondissement aléatoire a lieu uniquement après que les cases de données ont été agrégées, ce qui réduit la distorsion au minimum.

Outre l'arrondissement aléatoire, on a adopté la technique de la suppression des régions, afin d'assurer encore mieux la confidentialité des réponses des particuliers.

Dans le cadre de la suppression des régions, toutes les données caractéristiques se rapportant aux régions géographiques dont la population est inférieure à une taille donnée sont supprimées. L'importance de la suppression est fonction des facteurs suivants :

- si les données sont totalisées à partir de la base de données intégrales, les données sont supprimées si la population totale de la région est inférieure à 40 personnes;
- si les données sont totalisées à partir de la base de données-échantillon, les données sont supprimées si la population totale de la région, excluant les pensionnaires d'établissements institutionnels, est inférieure à 40 personnes, selon la base de données intégrales ou la base de données-échantillon.

Il y a quelques exceptions à ces règles :

- les données renfermant une répartition du revenu et les statistiques connexes sont supprimées si la population totale excluant les pensionnaires

d'établissements institutionnels de la région est inférieure à 250 personnes, selon la base de données intégrales ou la base de données-échantillon;

- si les données sont totalisées à partir de la base de données intégrales et se réfèrent aux codes postaux à six caractères, les données sont supprimées si la population totale de la région est inférieure à 100 personnes;
- si les données sont totalisées à partir de la base de données-échantillon et se réfèrent aux codes postaux à six caractères, les données sont supprimées si la population totale de la région excluant les pensionnaires d'établissements institutionnels selon la base de données intégrales ou la base de données-échantillon est inférieure à 100 personnes.

Les données pour les régions dont la population active est inférieure à 40 doivent être supprimées pour les totalisations sur le lieu de travail. Lorsque les tableaux portent sur la résidence et le lieu de travail, il faut appliquer à la fois la règle de suppression des régions standard et la règle de suppression des régions pour le lieu de travail.

Dans tous les cas, les données supprimées sont incluses dans les totaux ou totaux partiels du niveau d'agrégation supérieur approprié.

La technique de suppression est appliquée à tous les produits renfermant des données infraprovinciales (c.-à-d. la série des Profils, les tableaux sommaires de base, les produits personnalisés et semi-personnalisés), qu'il s'agisse de données intégrales ou de données-échantillon.

Dans le cas de la suppression des cases, il faut préciser une valeur minimale acceptable. Toutes les cases dont la valeur est inférieure au seuil établi sont supprimées et remplacées par des zéros. Les données sont toutefois incluses dans les totaux, partiels ou non, du niveau d'agrégation supérieur approprié.

Pour obtenir de plus amples renseignements sur la qualité des données du recensement, communiquer avec la Division des méthodes d'enquêtes sociales, Statistique Canada, Ottawa, (Ontario), Canada K1A 0T6, ou en composant le (613) 951-6934.

Notes Spéciales

Mise en garde pour Statut d'Indien inscrit, identité autochtone et appartenance à une bande indienne

Au recensement de 1996, réalisé en mai 1996, environ 488 000 répondants ont déclaré être inscrits en vertu de la Loi sur les Indiens du Canada. Ce chiffre est inférieur d'environ 19 % au chiffre du Registre des Indiens (601 000) de mai 1996 publié par le ministère des Affaires indiennes et du Nord canadien (MAINC). La différence entre le chiffre du recensement et celui du MAINC peut s'expliquer par plusieurs facteurs liés à chacune des sources de données. Pour le recensement de 1996, ces facteurs sont les suivants.

- Information manquante découlant du fait que 77 réserves indiennes et établissements indiens ne sont pas inclus dans le chiffre du recensement. Il s'agit des réserves indiennes ou des établissements indiens où le dénombrement n'a pas été autorisé, a été interrompu, a été mené trop tard, ou pour lesquels les données recueillies ont été jugées de qualité insuffisante. Statistique Canada estime que la population de ces réserves et établissements indiens partiellement dénombrés était d'environ 44 000 personnes, en mai 1996.
- Le sous-dénombrement de la population des réserves indiennes et des établissements indiens qui ont été dénombrés ainsi que le sous-dénombrement des Indiens inscrits vivant hors des réserves et des établissements indiens.
- D'autres facteurs, par exemple l'exclusion du chiffre du recensement des pensionnaires d'un établissement institutionnel et des Indiens inscrits qui étaient aux États-Unis ou outre-mer au moment du recensement, expliquent aussi en partie le fait que le chiffre du recensement soit moins élevé que le chiffre du MAINC.

Lorsqu'on utilise les données sur les Indiens inscrits tirées du recensement, il faut tenir compte de la couverture incomplète de la population totale d'Indiens inscrits. De plus, étant donné le lien très étroit qui existe entre le statut d'Indien inscrit et l'appartenance à une bande indienne, il faut également faire preuve de prudence lorsqu'on interprète les données déclarées sur l'appartenance à une bande indienne ou à une première nation. La même mise en garde s'applique, quoique dans une moindre mesure, à l'interprétation des données sur l'identité autochtone pour les Indiens de l'Amérique du Nord.

Néanmoins, les données sur le statut d'Indien inscrit, sur l'appartenance à une bande indienne et sur l'identité autochtone, lorsqu'elles sont combinées à d'autres renseignements démographiques et socioéconomiques tirés du recensement, contribuent à dresser un portrait général de la population autochtone dans les diverses régions du Canada.

Réserves indiennes et établissements indiens partiellement dénombrés

Lors du Recensement de 1996, le dénombrement n'a pas été autorisé sur certaines réserves indiennes et établissements indiens ou a été interrompu avant d'être mené à terme. De plus, la qualité des données recueillies pour certaines réserves indiennes et établissements indiens a été jugée insuffisante. Ces régions géographiques (au nombre de 77) sont appelées réserves indiennes et établissements indiens partiellement dénombrés.

Les données de 1996 ne sont donc pas disponibles pour les réserves et les établissements indiens partiellement dénombrés et ne sont pas comprises dans les totalisations. Les données sur les régions géographiques ayant une ou plusieurs de ces réserves ou établissements font donc l'objet d'un nota approprié. En raison des données manquantes, les utilisateurs doivent prendre note que les comparaisons (p. ex., des variations en pourcentage) entre 1991 et 1996 ne sont pas exactes pour les régions géographiques en cause. L'effet des données manquantes est très faible pour les régions géographiques de niveau plus élevé (Canada, provinces, régions métropolitaines de recensement et agglomérations de recensement) mais peut être important pour les régions plus petites où les réserves et les établissements indiens en cause représentent une plus grande proportion de la population.

Il a été possible d'obtenir des chiffres de population et des logements pour la réserve indienne Wendake (Québec). Ces chiffres certifiés s'élèvent à 1 462 personnes et à 563 logements privés occupés. Ces chiffres ne sont pas inclus dans les chiffres de population et des logements du recensement puisqu'ils ont été établis après le recensement en utilisant une méthodologie différente.

Une liste des réserves indiennes et établissements indiens partiellement dénombrés ainsi que les chiffres de la population et des logements privés occupés des deux derniers recensements (si les données sont disponibles) a été dressée et est présentée à l'Annexe 1.

Une liste des réserves indiennes et des établissements indiens partiellement dénombrés figure à l'Annexe 2. On a indiqué pour chacun la province, la division de recensement et, le cas échéant, la région métropolitaine de recensement ou l'agglomération de recensement (RMR/AR).

Résidents non permanents

En 1991 et en 1996, le Recensement de la population a dénombré à la fois les résidents permanents et les résidents non permanents. Les résidents non permanents étaient titulaires d'un permis de séjour pour étudiants ou d'un permis de travail, d'un permis

ministériel, ou étaient des demandeurs du statut de réfugié, ainsi que les membres de la famille qui vivaient avec eux au moment du recensement.

Avant 1991, seuls les résidents permanents du Canada étaient inclus dans le recensement (exception faite pour 1941). Les résidents non permanents étaient considérés comme des résidents étrangers et n'étaient pas dénombrés.

Présentement au Canada, les résidents non permanents forment un segment important de la population, en particulier dans plusieurs régions métropolitaines de recensement. Leur présence peut influencer la demande de services gouvernementaux tels que les soins de santé, l'éducation, les programmes d'emploi et la formation linguistique. L'inclusion des résidents non permanents au recensement facilite la comparaison avec les statistiques provinciales et territoriales (mariages, divorces, naissances et décès) qui incluent cette population. En outre, l'inclusion des résidents non permanents permet au Canada de mieux refléter la recommandation de l'ONU, à savoir que les résidents à long terme (personnes demeurant dans un pays pour un an ou plus) soient dénombrés au recensement.

Selon le recensement de 1991, il y avait 223 410 résidents non permanents au Canada, ce qui représente un peu moins de 1 % de la population totale. Lors du recensement de 1996, il y avait moins de résidents non permanents au Canada : 166 715 résidents non permanents ou 0,6 % de la population totale en 1996.

Le total des chiffres de population, de même que ceux de toutes les variables, sont touchés par ce changement apporté à l'univers du recensement. Les utilisateurs doivent faire preuve d'une très grande prudence lorsqu'ils comparent des données de 1991 ou de 1996 avec celles de recensements antérieurs pour des régions géographiques où la concentration de résidents non permanents est importante. Celles-ci comprennent les principales régions métropolitaines de recensement de l'Ontario, du Québec et de la Colombie-Britannique.

Même si tous les efforts possibles ont été déployés pour dénombrer les résidents non permanents, des facteurs tels que les problèmes linguistiques et la réticence à remplir un formulaire du gouvernement ou de comprendre l'utilité de leur participation peuvent avoir influé sur le dénombrement de cette population et s'être traduits par un sous-dénombrement.

Chiffres de population basés sur la résidence habituelle

Les chiffres de population présentés ici pour les différentes régions géographiques indiquent le nombre de Canadiens qui y ont leur lieu habituel de résidence, sans égard au lieu où ils se trouvaient le jour du

recensement. Sont également comptés les Canadiens séjournant dans un logement de la région en cause le jour du recensement et n'ayant pas de lieu habituel de résidence ailleurs au Canada, de même que ceux qui sont considérés comme des "résidents non permanents" (voir la note spéciale au sujet de ce groupe). Dans la plupart des régions, il n'y a guère de différence entre le nombre de résidents habituels et le nombre de personnes séjournant dans la région le jour du recensement. Toutefois, dans certains endroits, comme les lieux de villégiature et les régions où sont situés des camps de chantier importants, la différence entre ces deux chiffres peut être importante.

Type de construction résidentielle

Les logements mobiles, un type de construction, n'ont probablement pas tous été déclarés au recensement de 1996. Cette situation est possiblement due au fait qu'un certain nombre d'habitations mobiles ont été classées par erreur avec d'autres types de construction résidentielle. Dans les grandes régions géographiques, cette erreur ne devrait pas affecter de façon significative les autres catégories de logement, étant donné le nombre de logements relativement plus élevé dans ces régions. Cependant, pour des régions géographiques plus restreintes, l'influence pourrait être plus marquée.

Résidents temporaires

Contrairement aux recensements précédents, l'Étude sur les résidents temporaires n'a pas été réalisée en 1996. Par conséquent, on n'a pas vérifié (à l'aide d'un échantillon) si les résidents temporaires (personnes qui se trouvaient ailleurs qu'à leur domicile habituel le jour du recensement) ont été dénombrés à leur domicile habituel. Au Recensement de 1991, les personnes incluses par suite de l'Étude sur les résidents temporaires se répartissaient comme suit :

| Province/territoire | Total estimatif | Erreur type |
|---------------------------|--------------------|----------------|
| Canada | 92 584 | 2 307 |
| Terre-Neuve | 2 621 | 344 |
| Île-du-Prince-Édouard | 323 | 64 |
| Nouvelle-Écosse | 3 683 | 517 |
| Nouveau-Brunswick | 2 459 | 344 |
| Québec | 16 462 | 985 |
| Ontario | 30 920 | 1 379 |
| Manitoba | 4 098 | 412 |
| Saskatchewan | 4 808 | 452 |
| Alberta | 11 092 | 829 |
| Colombie-Britannique | 15 330 | 943 |
| Territoire du Yukon | 345 | 89 |
| Territoires du Nord-Ouest | 443 | 96 |

Abbreviations

- Nil or zero

Footnote(s)

- (1) Includes persons who did not work in 1995 but reported employment income.
- (2) Worked 49-52 weeks in 1995, mostly full time.
- (3) Worked 49-52 weeks in 1995, mostly part time, or worked 1-49 weeks.
- (4) Percentages may not add to 100% due to rounding of the data.
- (5) Including loss.
- (6) For persons with income.
- (7) Includes male and female lone-parent families.

Abréviations

- Néant ou zéro

Renvoi(s)

- (1) Comprend les personnes qui n'ont pas travaillé en 1995 mais qui ont inscrit un revenu d'emploi.
 - (2) A travaillé 49-52 semaines en 1995, surtout à plein temps.
 - (3) A travaillé 49-52 semaines en 1995, surtout à temps partiel, ou a travaillé 1-49 semaines.
 - (4) Il est possible que la somme des pourcentages ne soit pas de 100 % en raison de l'arrondissement des données.
 - (5) Comprend les pertes.
 - (6) S'applique aux personnes ayant un revenu.
 - (7) Comprend les familles
